```
Grade : VII
```

Basic concepts - A Flow Chart

- Time between one sunrise and the next is a day.
- Time between one new moon and other is a month.
- The time taken by the earth to complete one revolution of the sun is year.
- Clocks or watches are perhaps the most common time measuring devices.
- Periodic motion of a pendulum and watches.

## Simple Pendulum

- The to and fro motion of a simple pendulum is an example of a periodic or an oscillatory motion.
- The metallic ball of the pendulum is called the bob.
- The time taken by the pendulum to complete one oscillation is called its time period.
$>$ Meter : The standard unit of length.
$>$ Oscillation : Periodic movement of an object is called oscillation.
$>$ Pendulum : A weight fung form a string.

Speed : Speed=
Totaldistance covered

Time period
: The time taken by the pendulum to comple te one oscillation is called
its time period.

Objective Type Questions
(1 Markeack)
I. Multiple choice questions

1. The motion of pedal of a bicycle is?
a. Circular
2. Periodic
c. Straight line
d. O scillatory
2.Speed is;
a. Distance $x$ time 6. Distance / time c. Distance + time d. Distance -time
3. Distance is a;
a. Vector quantity
4. Scalar quantity
c. Both (a) and (b)
d. None of these
5. In a graph, on which axis dependent variable is shown?
a. $x$
6. y
c. On any axis
d. Depends on data
7. One millionth second is:
a. Microsecond
8. Nanosecond
c. Picosecond
d. None of these
9. A solar day is;
a. 24 h
10. 1440 min
c. 86400 sec
d. all of these
11. The distance moved by the veficle is measured by;
a. Odometer
12. gatvanometer
c. speedometer
13. Which of the following cannot be used for me as urement of time?
a. A leaking tap
14. Simple pendulum
c. Shadow of an object
d. 6 linking of eyes
15. Tow clocks $\mathcal{A}$ and $\mathcal{B}$ are shown in following fig. clock $\mathcal{A}$ fas an four and a minute fand, Whereas clock $\mathcal{B}$ has an hour hand, minute hand as well as a second hand. Which of the following statement is correct for these clocks?

a. $\mathcal{A}$ time interval of 30 seconds can be measured by clock $\mathcal{A}$
16. A time interval of 30 seconds cannot be measured by clock $\mathcal{B}$
c. Time interval of 5 minutes can be measured 6y 6oth $\mathcal{A}$ and $\mathcal{B}$
d. Time interval of 4 minutes 10 seconds can be measured by clock $\mathcal{A}$
17. Two students were asked to plot a distance-time graph for the motion described by table $\mathcal{A}$ and table $\mathcal{B}$.

## Table $\mathcal{A}$

| Distance move (m) | 0 | 10 | 20 | 30 | 40 | 50 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Time minutes | 0 | 2 | 4 | 6 | 8 | 10 |

Table $\mathcal{A}$

| Distance move (m) | 0 | 5 | 10 | 15 | 20 | 25 |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Time minutes | 0 | 1 | 2 | 3 | 4 | 5 |

5chool

The graph given in above figure is true for ;
a. $\operatorname{Both} \mathcal{A}$ and $\mathcal{B}$
6. A only
c. $\mathcal{B}$ only
d. neither $\mathcal{A}$ nor $\mathcal{B}$
11. A bus trave ls 54 km in 90 minutes. the speed of the 6 us is:
a. $0.6 \mathrm{~m} / \mathrm{s}$
6. $10 \mathrm{~m} / \mathrm{s}$
c. $5.4 \mathrm{~m} / \mathrm{s}$
d. $3.6 \mathrm{~m} / \mathrm{s}$
12. If we denoted speed by $\mathcal{S}$, distance $\mathcal{D}$ and time by $\mathcal{T}$, the relationsfip between these quantities is;
a. $\mathcal{S}=\mathcal{D} \mathcal{T}$
6. $\mathcal{T}=\frac{S}{D}$
c. $S=\frac{1}{1} \chi d$
d. $S=\frac{T}{D}$
13. O bserve following figure:

The time period of a simple pendulum is the time taken by it to travelfrom:
a. $\mathcal{A}$ to $\mathcal{B}$ and 6ack to $\mathcal{A}$
6. $O$ to $\mathcal{A}, \mathcal{A}$ to $\mathcal{B}$ and $\mathcal{B}$ to $\mathcal{A}$
c. $\mathcal{B}$ to $\mathcal{A}, \mathcal{A}$ to $\mathcal{B}$ and $\mathcal{B}$ to $O$
d. $\mathcal{A}$ to $\mathcal{B}$
14. Following figure sfows an oscillating pendulum:

Time taken by the bob to move from $\mathcal{A}$ to $C$ is $t_{1}$ and from $C$ to $O$ is $t_{2}$. The time period of this simple pendulum is;
a. $\left(t_{1}+t_{2}\right)$
6. $2\left(t_{1}+t_{2}\right)$
c. $3\left(t_{1}+t_{2}\right)$
d. $4\left(t_{1}+t_{2}\right)$
15. The correct symbol to represent the speed of an object is:
a. $5 \mathrm{~m} / \mathrm{s}$
6.5 mp
c. $5 \mathrm{~m} / \mathrm{s}^{-1}$
d. $5 \mathrm{~s} / \mathrm{m}$
16. Boojfo walks to his school which is at a distance he finds that the school is closed and comes back by a bicycle with his friend and reaches home in 20 minutes. His average speed in $\mathrm{km} / \mathrm{h}$ is:
a. 8.3
6.7 .2
c. 5
d. 3.6

| $1 . a$ | 2.6 | 3.6 | 4.6 | $5 . a$ | $6 . d$ | $7 . a$ | $8 . d$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $9 . c$ | $10 . a$ | 11.6 | $12 . c$ | $13 . a$ | $14 . d$ | $15 . a$ | 16.6 |

II. Multiple choice questions

1. What part of second is called nano-second?
(a) One fundredth
(6) One thousandth
(c) One milfionth
(d) One billionth
2. Which of the following records the distance travelled by the ve hicles?
(a) Manometer
(b) Odometer
(c) Speedometer
(d) Motometer
3. The relation between speed and displacement is
(a) Displacement $=$ Speed $/$ Time
(6) Displacement $=$ Speed $x$ Time
(c) Displacement $=$ Time $/$ Speed
(d) None of these
4. On which axis is dependent variable represented?
(a) $x$-axis
(b) $y$-axis
(c) On any axis
(d) Depends on the data
5. Time period of a simple pendulum de pends upon
(a) Weight of 606
(6) Length of pendulum
(c) $\mathcal{B o t h}$
(d) None of above

| $1 . d$ | 2.6 | 3.6 | 4.6 | 5.6 |
| :---: | :---: | :---: | :---: | :---: |

## I. Fill in the blanks

1. The distance covered by an object in $\qquad$ is called its speed.
2. The symbols of all units are written in $\qquad$ -.
3. The unit of speed is $\qquad$ -.
4. $\qquad$ is used for me asuring speed.
5. shadow of an object is $\qquad$ at noon.
6. Roman used $\qquad$ to measure time.
7. $\mathcal{A}$ $\qquad$ is one billionth of a second.
8. The standard unit of time is $\qquad$ _.
9. Motion and $\qquad$ are relative terms.
10. $\qquad$ motion is used in clocks.

| 1. Unit time | 2.Singular | $3 . \mathrm{m} / \mathrm{s}$ | 4. Speedometer | 5.S fortest |
| :--- | :--- | :--- | :--- | :--- |
| 6. S and clocks | 7.nanosecond | 8.Second | 9.Rest | 10. Periodic |

II. Fill in the blanks
(i) The time taken by a simple pendulum to comple te one oscillation is called its
(ii) Time period of a pendulum depends on its $\qquad$
i. time period ii. Length
I. Match the following.

| Column $\mathcal{A}$ |  | Column $\mathcal{B}$ |  |
| :--- | :--- | :---: | :--- |
| (i) | Day | (a) | Second |
| (ii) | Month | (b) | $\mathrm{m} / \mathrm{s}$ |
| (iii) | Time | (c) | metre |
| (iv) | Speed | (d) | The time from one sunrise to the next |
| (v) | Distance | (e) | One newmoon to the next |

| i. $d$ | ii.e | iii. a | iv. $b$ | v.c |
| :---: | :---: | :---: | :---: | :---: |

| Colum A | Column $\mathcal{A}$ |
| :--- | :--- |
| a. Month | i. Speed |
| b.Speedometer | ii. Oscillation |
| c.Sundial | iii. $\mathrm{m} / \mathrm{s}$ |
| d. Sand Clock | iv. De vice to measure distance travelled by ve ficle |
| e. Odometer | v. Romans |
| f. Speed | vi. Iantar Mantar |
| g. Pendulum | vii. Device to measure speed |
| f. Movement of ofject in unit time | viii. One newmoon to the next |

| $a . v i i i$ | $6 . v i i$ | $c . v i$ | $d . v$ | $e . i v$ | $f . i i i$ | $g . i i$ | f.i |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## I. True or False

(i) The basic unit of time is second
(ii) The object moving along a straight line keeps changing its speed, its motion is called uniform.
(iii) The symbols of units are written in plural
(iv) Faster veficle fias a figher speed
(v) The age of a person is expressed in days.

| (i) $\mathcal{T r u e}$ | (ii) False | (iii) False | (iv) $\mathcal{T r u e}$ | (v) False |
| :---: | :---: | :---: | :---: | :---: |

Quiz Time

1. Name the physicalquantity which helps to know which object is faster or slower.
2. If we say that a train is moving 40 kilometres per four, what do you mean by this statement?
3. Write the basic unit of time?
4. Name the most common device which is used to measure the time.
5. An object changes its position with respect to an other object. What is this process called?
6. Give an example of a device which shows periodic motion.
7. Write the formula to calculate speed
8. What are the factors which affect the time period of a simple pendulum?
9. Name any two types of graphs
10. Name the device which is used to record the speed directly in $k m / 6$ in veficles.
11. Speed
12. It means that train cover 40 km in one four
13. Second
14. Watch or clock
15. Motion
16. Simple Pendulum
17. Speed $=$ Distance $/$ Time
18. (i) Length of Pendulum
(ii) Acceleration due to gravity
19. (i) Bar grapf
(ii) Line grapf
20. Speedometer

## $\mathcal{N C E R T} \operatorname{CO} \mathcal{N R N E R}$

> Intext Question

1. Complete the table:

Table 13.1 some examples of different type of motion

| Example of motion | Iype of motion |
| :--- | :--- |
|  | Along a straight line/circular/periodic |
| Soldiers in a march past | Straight line |

| $\mathcal{B u l l o c k}$ c art moving on a straight road | S traight line |
| :--- | :--- |
| Hands of an athlete in a race | Pe riodic |
| Fedals of a bicycle in motion | Circular |
| Motion of the earth around the sun | Circular / Periodic / revolutional |
| Motion of a swing | Periodic |
| Motion of a pendulum | Periodic |

1. Which veficle is moving the fastest of all?

Blue one.
2. Which one of them is moving the slowest of all?

Red one.
3. Would you say that the bus is moving faster than the bicycle?
ges.
4. Have you ever wondered how clock and watches measure time?
$\mathcal{A l l}$ of them make use of some periodic motion.
5. Time periodic of a simple pendulum.

$$
\text { Length of the string }=100 \mathrm{~cm}
$$

| $S . \mathcal{N} o$ | Time taken for 20 oscillations | Time period |
| :---: | :--- | :--- |
| 1. | 42 s | 2.1 s |
| 2 | 40 s | 2.0 s |
| 3. | 41 s | 2.05 s |

6. Boojfo is wondering fow many seconds there are in $a$ day and fow many fours in a year. Can you help fim?

$$
\begin{aligned}
& 1 \text { day }=24 \times 60 \times 60 \mathrm{~s}=68,400 \mathrm{~s} \\
& 1 \text { Year }=365 \times 60 \times 24 \times 60 \mathrm{~s}=31,536,0000 \mathrm{~s}
\end{aligned}
$$

7. Pakeli wondered fow time was measured when pendulum clocks were not available.

Many time measuring devices were adapted in different parts of the world before the pendulum clockwere invented. Sundials, water clocks and sand clocks are concrete examples, of such devices.
8. Distance moved and time taken by a moving ball

| Name of the <br> group | Distance moved 6y <br> the ball (m) | Time taken (S) | Speed= Distance / |
| :---: | :---: | :---: | :---: |
| Time taken $(\mathrm{m} / \mathrm{s})$ |  |  |  |
| $\mathcal{A}$ | 50 | 5 | $50 / 5=10$ |
| $\mathcal{B}$ | 70 | 7 | $70 / 7=10$ |
| $\mathcal{C}$ | 40 | 8 | $40 / 8=10$ |
| $\mathcal{D}$ | 100 | 4 | $100 / 4=25$ |
| $\mathcal{E}$ | 80 | 10 | $80 / 10=8$ |

9. Rockets, launching satellites into earth's orbit, often attain speeds up to $8 \mathrm{~km} / \mathrm{s}$. on the other hand, a tortoise can move only with a speed of about $89 \mathrm{~cm} / \mathrm{s}$ calculate fow fast is the rocket compared with the tortoise?

$$
\begin{aligned}
& \text { Speed of rocket }=8 \mathrm{~km} / \mathrm{s}=8000 \mathrm{~m} / \mathrm{s} \\
& \text { Speed of rocket } \\
& \text { Speed of tortise }=\frac{8000 \mathrm{~m} / \mathrm{s}}{80 / 100 \mathrm{~m} / \mathrm{s}} \\
&=\frac{8000 \times 100}{80} \\
&=9000
\end{aligned}
$$

10. Boojko wants to know whether there is any device that measures the speed.

Yes, Speedometer
11. Can you tell how far is the picnic spot from the school?

80 km .
12. Can you calculate the speed of the bus?

$$
\begin{aligned}
\text { Distance } & =80 \mathrm{~km} \\
\text { Time } & =8: 00 \mathcal{A M}-10: 00 \mathcal{A M} \\
& =2 \mathrm{frs} \\
\text { speed } & =\frac{\text { Distance }}{\text { Time }}=\frac{80 \mathrm{~km}}{2 \mathrm{hrs}} \\
& =40 \mathrm{~km} / \mathrm{kr}
\end{aligned}
$$

13. How much is this distance in $\kappa$ m?

$$
10 \mathrm{~km}
$$

14. Can you now fielp Pafeli to find the distance moved by the bus at $9: 45 \mathcal{A M}$ ? 70 km
15. Can you also find the speed of the bus from its distance-time graph?

70 km
Distance travelled $=80 \mathrm{~km}$
Time required $\quad=8 ; 00 \mathcal{A M}-10: 00 \mathcal{A M}$

$$
=2 \mathrm{hrs}
$$

Speed $\quad=\frac{\text { Distance taravalled }}{\text { time Required }}$
$=\frac{80 \mathrm{~km}}{2 \mathrm{hr}}$
$=40 \mathrm{~km} / \mathrm{hr}$

Text Question

1. Classify the following as motion along a straight line, circular or oscillatory motion:
i. Motion of your frands while running.
ii. Motion of a forse pulling a cart on a straight road.
iii. Motion of a child in a merry-go-round.
iv. Motion of a child on a see-saw.
v. Motion of the fiammer of an electric bell.
vi. Motion of a train on a straight bridge.
i. Oscillatory
ii. Straight line
v. O scillatroy vi. Straight line.
2. Which of the following are not correct?
i. The basic unit of time is second.
ii. Every object moves with a constant speed.
iii. Distance between two cities are measured in kilometes.
iv. The time period of a given pendulum is not constant.
v. The speed of a train is expressed in $m / \hbar$.
$i i, \mathcal{V}$
3. A simple pendulum takes 32 s to complete 20 oscillations. What is time period of the pendulum?

Time taken for 20 oscillation
Time taken for 1 oscillation

$$
\begin{aligned}
& =32 s \\
& =\frac{32 s}{20}=1.65
\end{aligned}
$$

4. The distance between two stations is 240 km . $\mathcal{A}$ train takes 4 fours to cover this distance. Calculate the speed of the train.

$$
\begin{array}{ll}
\text { Distance } & =240 \mathrm{~km} \\
\text { Time } & =\frac{\text { Distance }}{\text { Time }} \\
\text { Speed } & \\
& =\frac{240 \mathrm{~km}}{4 \mathrm{~h}} \\
& =60 \mathrm{~km} / \mathrm{h}
\end{array}
$$

5. The odometer of a car reads 57, 321.0 km when the clock shows the time $08.30 \mathcal{A M}$. What is the distance moved by the car, if at $08: 50 \mathcal{A M}$, the odometer reading fas changed to $57,336.0 \mathrm{~km}$ ? Calculate the speed of the car in $\mathcal{K i m} / \mathrm{min}$ during this time. Express the speed in $\mathrm{Km} / \mathrm{h}$ also.

Odometer reading at $8.30 \mathcal{A M} \quad=57321.0 \mathrm{~km}$
Odometer reading at $8.50 \mathcal{A M}$

$$
=57336.0 \mathrm{~km}
$$

$$
=(57336.0-57321.0 \mathrm{~km}
$$

$$
=15.0 \mathrm{~km} .
$$

Time taken

$$
=8: 50 \mathcal{A m} \cdot 8: 30 \mathcal{A m}
$$

$$
=20 \mathrm{~min}
$$

$$
=\frac{\text { Distance }}{\text { Time }}
$$

$$
=\frac{15 \mathrm{~km}}{20 \mathrm{~min}}
$$

$$
=0.75 \mathrm{~km} / \mathrm{min}
$$

$$
=\frac{0.75 \mathrm{~km}}{\frac{1}{60} h}\left(i \min =\frac{1}{60} h\right)
$$

$$
=0.75 \times 60 \mathrm{~km} / \mathrm{h}
$$

$$
=45 \mathrm{~km} / \mathrm{h}
$$

6. Samla takes 15 minutes from fer house to reach fer school on a bicycle. if the bicycle has a speed of $2 \mathrm{~m} / \mathrm{s}$, calculate the distance between her fiouse and the school.

Speed
Time

Distance

|  | $=2 \mathrm{~m} / \mathrm{s}$ |
| ---: | :--- |
|  | $=15 \mathrm{~min}=15 \times 60 \mathrm{~s}$ |
|  | $=900 \mathrm{~s}$ |
|  | $=$ Speedxtime |

$$
\begin{aligned}
& \text { (3) } \begin{aligned}
& =2 \mathrm{~m} / \mathrm{s} x \\
& =1800 \mathrm{~m}
\end{aligned} \\
& =\quad \frac{1800}{1000} \mathrm{~km} \\
& =\quad 1.8 \mathrm{~km}
\end{aligned}
$$

7. Show the shape of the distance - time graph for the motion in the following cases:
i. $\mathcal{A}$ car moving with a constant speed.
ii. A car parked on a side road.
(i)

Time
8. Which of the following relations is correct?
i. Speed $=$ Distance $\chi$ Time
ii. Speed $=\frac{\text { Distance }}{\text { Time }}$
$\begin{array}{lll}\text { iii. Speed } & = & \frac{\text { Time }}{\text { Distance }} \\ \text { iv. Speed } & = & \frac{1}{\text { Distance } \times \text { Time }}\end{array}$
ii. Speed $\frac{\text { Distance }}{\text { Time }}$
9. The basic unit of speed is:
i. $\mathcal{K} m / \min$
ii. $m / m$ in
iii. 15 km
iv. $m / s$
(iv) $\mathrm{m} / \mathrm{s}$
10. A car moves with speed of $40 \mathrm{~km} / \mathrm{h}$ for 15 minutes and then with a speed of $\mathrm{km} / \mathrm{h}$ for the next 15 minutes. the total distance covered by the car is
i. 100 km
ii. 25 km
iii. 15 km
iv 10 km

Distance travelled in first $15 \mathrm{~min}=$ speed $x$ time

$$
\begin{aligned}
& =40 \mathrm{~km} / \hbar \times 15 \\
& =\frac{40 \mathrm{~km}}{\mathrm{~h}} \times \frac{15}{60} \mathrm{~h} \\
& =10 \mathrm{~km}
\end{aligned}
$$

Distance travelled in last 15 min

$$
\begin{aligned}
& =\text { Speed } \times \text { Time } \\
& =60 \mathrm{~km} / \mathrm{h} \times 15 \mathrm{~min} \\
& =60 \mathrm{~km} / \mathrm{h} \times \frac{15}{60} \mathrm{~h} \\
& =15 \mathrm{~km} \\
& =(10+15) \\
& =25 \mathrm{~km}
\end{aligned}
$$

11. Suppose the two photographs, shown in Fig. A and Fig. B, fad been taken at an interval of 10 seconds. If a distance of 100 metres is shown by 1 cm inthese photographs, calculate the speed of the blue car.

Veficles moving in the position of veficles shown same direction on a road in shown in
after some time

$$
\text { Speed }=100 \mathrm{~m} / 10 \mathrm{~s}=10 \mathrm{~m} / \mathrm{s}
$$

12. Figure shows the distance - time graph for the motion of two veficles $\mathcal{A}$ and $\mathcal{B}$ which one of them is moving faster?

13. Which of the following distance-time graphs shows a truck moving at the speed which is not constant?

(i)

(ii)

(iii)

(iv)

Ans: (iii)
I. Very short Answer type question.

1. What is motion?

When a body changes its position continuously with respect to time other body, then it is said to be in motion.
2. How many types of motion are there? $\mathcal{N a m e}$ them
(1)
Translatory motion
2) Rotatory motion
3) Rolling motion

Periodic motion 5) Oscillatory and vibratory motion
3. Name the physicalquantity which helps to know which object moves faster or slower?

Speed
4. What is speed?

The distance covered by a object in a unit time is called its speed
5. What is the basic unit of speed?

Metre/second
6. What do you mean when you say that a car is moving with a speed of 50 kilometres per hour?

It means that the car will cover 50 kilometres distance in one four.
7. What is the basic unit of time?

Second
8. How did our ancestors find out the time of the day?

Our ancestors could tell the approximate time of the day by looking at shadows
9. What time interval was called as day by our ancestors?

The time interval between one sunrise to the next sunrise was called a day
10. How did our ancestors measure time interval of a month?
$\mathcal{A}$ month was measured from one new moon to the next.
11. What was a year as per our ancestors?
$\mathcal{A}$ year was fixed as the time taken by earth to complete one revolution of the sun.
12. What are the most common devices used to measure time?

Clocks or watches are most common time -measuring devices
13. What is the common property of most of the clocks?

All of them make use of some periodic motion
14. Give an example of periodic motion

One of the well-known periodic motion is that of a simple pendulum is called bob.
15. What is a bob?

The metallic ball in simple pendulum is called bob.
16. What is the time period of a simple pendulum?

The time taken by the pendulum to complete one oscillation is called its time period
17. What is the relation between speed distance and time?

Distance covered $=$ Speed $\chi$ Time
18. What are the factors that affect the time period of a simple pendulum?
(i) Length of pendulum
$\cdots$ -
(ii) Acceleration due to gravity
19. Name the devices used by your ancestors to measure the time before pendulum clocks $S$ undials, water clocks, sand clocks
20. What is Speedometer?

The device which is used to record the speed directly in $k m / \hbar$ in the vehicles is called speedometer.
21. What is the function of odometer?

Odometer is used to measure the distance moved by the veficle
22. What are $x$ and $y$ axis in a grapf?

The forizontalline in a graph is called $x$-axis and verticalline is called $y$-axis
23. What is origin in a graph?

The point where the $x$-axis and $y$ axis both intersect each other is called origin of graph
24. What is the independent variable?

The variable which increases or decreases freely and does not depend on other variables is called independent variable
25. On which axis dependent variables are represented?

The dependent variable are represented on $y$-axis
26. How many types of graphs are there?

There are following types of graphs
(i) Bar graph
(ii) Line graph)
(iii) Pie chart
27. What is simple pendulum?

The simple device consists of a small metallic ball and at the end of thin thread is called simple pendulum.
28. What is length of pendulum?

The length of the thread including radius of 606 is called length of the pendulum.
29. What is the ratio of time taken to complete various oscillations?

The pendulum of a given length takes always same to comple te one oscillation
30. Name the device which is used to measure speed

Speedometer
31. Name the device which is used to measure distance travelled

Odometer
32. Name two types of axis in the graph
i) $X-\mathcal{A x}$ is
ii) $\mathscr{Y} \cdot \mathcal{A x}$ is

1. Define motion.

Motion is the change in the position of a body with respect to its surrounding and time.
2. When does a motion become uniform or non- uniform?

When a body covers equal distance in equal interval of time, the motion is uniform, but if it covers unequal distance in a given time, it is non- uniform motion.
3. Define speed.

Speed is the distance covered by a body in a unit time or it is equal to distance travelled divide d by time. $s=\frac{d}{t}$
4. What are S.I units of time and speed?

The S.I unit of time is second (s) and that of speed is meter per second $\left(\mathrm{ms}^{-1}\right)$.
5. Name some ancient clocks used by our ancestors.

Our ancestors used sundial, sand clock or candle clock to meaure time.
6. What is a stop watch?

Stop watch can measure time up to fraction of second and can be stopped or started at any moment.
7. What is a simple pendulum?

A simple pendulum consists of a small non-magnetic ball like body suspended by alight string.
8. What device are fitted in veficles to record speed or distance?

Odometer is fitted to record the distance covered and speedometer is fitted to record the speed of the veficle at any moment.
9. What is the principle on which most of the clocks works?

Most of the clocks work on the principle of periodic motion.
10. On what factors the time period of pendulum depends?

Periods of a pendulum depends upon - (i) length of the pendulum and (ii) Accelerationdue to gravity.
11. What do you mean by a graph?
$\mathcal{A} \operatorname{simple}$ graph cangive the relation between two variable, e.g., distance and time.
12. What do you mean by origin of grapf?

The origin of agraph is the intersection point of two axes.
13. What is solar day?

The gap between two consecutive noons is taken as the unit of time called solar day. It is equal to 24 frs .
14. A Simple pendulum takes 45 sec to complete 30 oscillations. What is the time period of the pendulum?

Time taken to complete 30 oscillations
Time taken to complete 1 oscillation

$$
\begin{aligned}
& =45 \mathrm{sec} \\
& =45 / 30 \quad=1.5 \mathrm{sec} . \\
& =1.5 \mathrm{sec} .
\end{aligned}
$$

One oscillation $=$ Time period
15. Pakeli and Boojho have to cover different distances to reach their school but they take the same time to reach the school. what can you say about the ir speed?

Their speed will not be same.
16. A spacestip 36,000 km in one four. Express its speed in $\mathrm{km} / \mathrm{s}$.

Speed $=\frac{\text { distance }}{\text { Time }}=\frac{36000}{60 \times 60}=10 \mathrm{~km} / \mathrm{sec}$
17. If Boojho covers a certain distance in one four and Pafeli covers the same distance in two hours, who travels in a figher speed?

Boojho moves at a figher speed as he covers the same distance in alesser time than
Pafeli.
18. A simple pendulum is oscillating between two points $\mathcal{A}$ and $\mathcal{B}$ as shown in figure. Is the motions of the 606 uniform or non- uniform.

$\mathcal{N}$ on-uniform motion.

III. Very sfort Answer type question.

1. Define speed.

Speed is defined as the ratio of the total distance travelled by a body to the total time taken.
2. Which speed is greater: $30 \mathrm{~m} / \mathrm{s}$ or $30 \mathrm{~km} / \mathrm{h}$ ?
$30 \mathrm{~m} / \mathrm{s}$
3. What is a pendulum?

A pendulum is a device which has a metallic ball (called bob) suspensed by a long thread from a rigid support.
4. What is the advantage of distance-time graphs?

It is useful in calculating the speed of the object and also tells the type of its motion. 5. Define time period of a simple pendulum.

The time period of the simple pendulum is defined as the time required by the pendulum to complete one oscillation.
6. The distance-time graph of an object is a straight line perpendicular to the distance axis. What does this graph indicate about the motion of the object?

It indicates that the object is not moving (stationary).
I. Sfort Answer type question.

1. Distinguisf between uniform and non-uniform motion.

If a body covers equal distance in interval of time, it is said to be in a uniform motion. For example, a car moving along a straight line. If a body covers unequal distance in un equal intervals of time, it is said to be in non-uniform motion. For example, a racing forse.
2. Explain with the help of an example that the states of rest and motion are relative terms.

When you are driving a car, the car is said to be in motion because it is moving relative to the road but you are said to be at rest because you are at rest relative to the moving car.
3. Complete the data of the table given below with the help of the distance-time graph given in figure.

| Distance (m) | 0 | 4 | $?$ | 12 | $?$ | 20 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time (s) | 0 | 2 | 4 | $?$ | 8 | 10 |

| Distance (m) | 0 | 4 | 8 | 12 | 16 | 20 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time (s) | 0 | 2 | 4 | 6 | 8 | 10 |

4. The average age of children of Class VII is 12 years and 3 months. Express this age in seconds.
( $\mathfrak{N C E R T}$ Exemplar)

$$
\begin{aligned}
12 \text { years } 3 \text { montfs } & =12 \times 365 \times 3 \times 30=4470 \text { days } \\
& =4470 \times 24 \times 60 \times 60 \mathrm{~s} \\
& =386208000 \mathrm{~s}
\end{aligned}
$$

5. Starting from $\mathcal{A}$, Pafieli moves along a rectangular path $\mathcal{A B C D}$ as shown in figure below. She takes 2 minutes to traveleach side. Plot a distance time graph and explain whether the motion is uniform or non-uniform.
( $\mathfrak{N C E R T}$ Exemplar)

Since the distance covered per unit time for the entire distance covered is not the same, the motion is non-uniform.

6. Plot a distance time graph of the tip of the second hand of a clock by selecting 4 points on $x$-axis and $y$-axis respectively. The circumference of the circle traced by the second hand is 64 cm . (NCERT Exemplar)

| Time (s) | $x$ | 15 | 30 | 45 | 60 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Distance (cm) | $y$ | 16 | 32 | 48 | 64 |

7. Suppose the two photograpfs, sfown in figures given below, fad been taken at an interval of 10 seconds. If a distance of 100 metres is shown by 1 cm in the se photograpfis, calculate the speed of the car marked $\mathcal{A}$.

The distance covered by the car from one strip to another, while is measured by scale is 1.4 cm .

Given, 1 cm is equivalnet to 100 m .
Therefore, 1.4 cm is equivalent to 140 .
Distance travelled by the car $=140 \mathrm{~m}$
Time interval between the two photographs = 10 s

$$
\text { Speed }=\frac{\text { Distance covered }}{\text { Time taken }}=\frac{140}{10}=14 \mathrm{~m} / \mathrm{s}
$$

8. Show the shape of the distance time grapf for the motion in the following cases.
a. $\mathcal{A}$ car moving with a constant speed.
9. A car parked on a side road.
a. $\mathcal{A}$ car moving with a constant speed covers equal distance in equal intervals of time.

10. The distance - time grapf of a car parked on a road side is such that with the increase in time, there is no change in distance.

## Time

II．Sfort Answer type question．

1．What do you mean by average speed？
The total distance covered by an object divided by the total time taken is called average speed．

Average speed $=$ Total distance covered $/$ Total time taken
2．Explain uniform and non－uniform motion
Uniform Motion ：If anobject is moving along a straight line with a constant speed，then the motion of object is called uniform motion．The bus moving at constant speed then the motion of objects is called uniform motion．The bus moving at constant speed is an example of uniform motion．
$\mathcal{N}$ on－uniform motion：If the speed on an object moving along a straight line keeps changing，its motion is said to be a non－uniform motion．For example movement of bus or car． 3．What is an oscillation？

An oscillation is the movement of a pendulum from its one extreme position to the other extreme position and then back to the former position．

4．Complete the following table for a pendulum at different places and calculate ave rage time
period of the pendulum

Table 13.1: Time period of a simple pendulum Length of the string $=100 \mathrm{~cm}$

| S. $\mathcal{N} o$. | Time taken for 20 oscillations | Time period |
| :--- | :--- | :--- |
| 1 | 42 s | 2.1 s |

Ans :

| $S . \mathcal{N}$. | Time taken for | 20 oscillations | Time period |
| :--- | :--- | :--- | :--- |
| 1 | 42 s | 2.1 s |  |
| 2 | 40 s | 2 s |  |
| 3 | 38 s | 1.9 s |  |

Ave rage time period $=\frac{2.1+2+1.9}{3}=\frac{6}{3}=2 \mathrm{~s}$
5. Explain how Galile o contributed to the development of clocks.

Once Gatile o was sitting in a church. He noticed that a lamp suspended from the ceiling with chain was moving slowly from one side to other. He was surprised to find that his pulse Geat the same number of times during the interval in which the lamp completed one oscillation. He found that a pendulum of a given length takes always the same time to complete one oscillation. This observation led to the development of pendulum clocks and other watches.
6. On the basis of the following table, calculate the speed of the car between $9.00 \mathcal{A M}$
to $10 \mathcal{A M}$ time interval
Table 13.2: Odometer reading at different times of the journey

| Time $(\mathcal{A M})$ | Odometer reading | Distance from the starting point |
| :---: | :---: | :---: |
| $8.00 \mathcal{A M}$ | 36540 km | 0 km |
| $8.30 \mathcal{A M}$ | 36560 km | 20 km |
| $9.00 \mathcal{A M}$ | 36580 km | 40 km |
| $9.30 \mathcal{A M}$ | 36600 km | 60 km |
| $10.00 \mathcal{A M}$ | 36620 km | 80 km |

Initial time $=9.00 \mathcal{A M}$

Final time $=10.00 \mathcal{A M}$
Initial reading $=36580 \mathrm{~km}$
Final reading $=36620-36580=40 \mathrm{~km}$
Total time taken =10 $\mathcal{A M}-9 \mathcal{A M}=14 \curvearrowleft$

We know that speed = Total distance cover / total time taken
$=40 \mathrm{~km} / 1.00 \mathrm{~h}=40 \mathrm{~km} / \mathrm{h}$
7. In a cricket matcf a team scored $1,5,3,10,2$ and 6 runs in first 6 overs respectively. Show these runs by a bar graph.

8. How can you select a suitable scale to draw a grapf?

The points to be kept in mind while choosing the most suitable scale to drawing graph are:
i) Difference between highest and lowest valued of eack quantity
ii) Intermediate values of each quantity
iii) To utilise the maximum part of the paper on which the graph is to be drawn,
II. Short Answer type question-I

1. Given below a table showing time taken by a car to travel various distances.

What do you infer form this data?
We see that the car cover a distance of 5 km in first 10 min . it again covers a distance of 5 km in next 10 min . in the next 10 min , it covers 10 km , thenagain 10 km in 10 min . then it
covers 5 km in 10 min . this shows that the car travels unequal distances in various slots of 10 min. So we conclude that the car is moving with a non-uniform speed.
2. Give the nature of distance-time graph both for uniform motion and non- unform motion.

3. What is a sand clock?

Sand clock is a clockused by Romans to measure a constant time called four, it consists two chambers fitted over one another filled with an amount of sand and it takes exactly one four to empty a chamber. Once the upper chamber is completely emptied, the chamber is turned upside down to record the time again. It is atso called hour glass.

4. What is a sundial?
$\mathfrak{A}$ sundialconsists of triangular metallic plate called gnomon fixed vertically at the centre of a circular plate. The device is placed in the open in such a way that gnomon points in the north-south direction. it works on the principle that as position of sun in the sky changes, the position and length of shadowalso changes, the se are calibrated with time.

5. What is a simple pendulum? What is the time - period of a pendulum?

A simple pendulum fias a small metallic ball called bob suspended from a rigid stand by a thread the time taken by the pendulum to comple te one oscillation is called time period. One oscillation of a pendulum is completed when the 6 ob moves from postion o to $\mathcal{A}$ and then from $\mathcal{A}$ to $\mathcal{B}$ and then back to $\mathcal{A}$ or from $\mathcal{A}$ to $\mathcal{B}$ to $\mathcal{A}$.

6. Differentiate between uniform and non- uniform motion.

When a body moves with a constant speed i.e., it covers equal distances in equal interval of time, the motion is said to be uniform.
$\mathcal{N}$ on- uniform motion is the different distances covered in equal interval of time. Such a body moves with a variable speed.
7. a. Which of the two veficles $\mathcal{A}$ and $\mathcal{B}$ is moving faster?

6. Which of the veficle is moving with a constant speed?

a. $\mathcal{A}$ is faster, being higher slope
6. $\mathcal{A}$ is moving with a constant speed.
8. a. What are nanosecond and microsecond?
6. change $30 \mathrm{~km} / \mathrm{h}$ into $\mathrm{m} / \mathrm{s}$
a. 1 microsecond $\quad=10^{-6} \mathrm{sec}$.

1 nanosecond $=10^{-9} \mathrm{sec}$.
c. 30 km in 1 hour
$30 \times 1000 \mathrm{~m}$ in $1 \times 60 \times 60 \mathrm{~seconds}$

$$
=\frac{30}{60} \times \frac{100}{60}=8.33 \mathrm{~ms}^{-1}
$$

9. a. What is called the bob of the pendulum?
10. A simple pendulum takes 35 s to complete 20 oscillations. With is the time-period of the pendulum?
a. The metallic ball hanging by wire $/$ string is called bob.
11. Time to comple te 20 oscillations $=35 \times 5$

Time to complete one oscillation $=\frac{35}{20}$
$=\quad 1.75 \mathrm{sec}$.
One oscillation $\quad=$ time period $=1.75 \mathrm{sec}$.
10. $\mathcal{A}$ train is running at a speed of $45 \mathrm{~km} / \mathrm{h}$. How long will it take to reach Lucknow from $\mathcal{D e}$ 作i when the distance between two stations is $350 \mathrm{~km} / \mathrm{h}$ $\qquad$
Speed of train $\quad=45 \mathrm{~km} / \mathrm{h}$
Train to cover 45 km
Train covers 350 km
$=\quad 1 \mathrm{~h}$
$=\frac{350}{45}=7.77 \mathrm{four}$
11. A postman takes 12 minutes to reach post office from his house by riding fis bicycle. If he is running at the speed of $3 \mathrm{~m} / \mathrm{se}$, calculate the distance between his house and post office in km.

Time taken by postman

Postman runs in one second
Postman runs in $12 \times 60$ second

$$
\begin{aligned}
& =12 \text { minutes } \\
& =3 \mathrm{~m} \\
& =\text { or } 12 \mathrm{~min} \\
& =3 \times 12 \times 60 \\
& =2160 \mathrm{~m} \\
& =2.16 \mathrm{~km}
\end{aligned}
$$

12. The odometer of a car reads 2552 km initially. It reaches its destination in 30 minutes which is 2584 km far. calculate the speed of the car in $\mathrm{Km} / \mathrm{h}$.

Distance covered $=2584-2552=32 \mathrm{~km}$
Time taken $=30 \mathrm{~min}=1 / 2 \mathrm{~h}$
Speed $\quad=32 x 1 / 2=64 \mathrm{~km} / \mathrm{h}$
13. What are the limitations of a sundial?

There are two limitations of using sundial:
i. Sundials cannot be used after sunset or on a cloudy day.
ii. Sundials cannot be carried along to different places.
14. What is meant by slow and fast motion.
$S$ low and fast are relative terms. Slow motion of a body means speed is lower than the other body which is running fast.
II. Short Answer type question-II

1. Write three differences between speed and velocity.

Differences between speed and velocity:

| Speed | Velocity |
| :--- | :--- |
| 1. It is the distance covered by a body | It is the distance travelled by a body in |
| per unit time in any direction. | a given direction. |
| 2. It is a scalar quantity. | It is a vector quantity. |
| 3.It is always positive or zero but never | It may be positive or negative or zero. |
| negative. |  |

2. Write three main difference between distance and displacement.

Differences between distance and displacement.

1. Distance is the length of the actual path covered by a body, irrespective of its direction of motion.
2. Distance between two given point may be same or different for different paths chosen.
3. it is scalar quantity,
4. Distance covered is always positive or zero.

Displacement is the shortest distance
between the initial and final positions of a body in a given direction.

Displacement between two given points is atways same.

Its vector quantity.
Displacement covered may be positive, negative or zero.
3. In a match, a team scored 200 runs, out of which they made tweleve four, three sixes, twenty times three runs, twenty times two runs and thirty four times one run. Show this by a pie chart. (Approx)

4. What were the definitions of a day, a month and a year for our ancestors? Day Time between two sunrise.

Month : time between one new moon to the next.
Year : time take byearth to complete one revolution of the earth.
5. What is a pendulum? How can it be used to determine time?

Pendulum is a simple device which shows periodic motion. A simple pendulum consists of a non- magnetic metal ball called bob. This bob is suspended with the felp of a string. The open end of the string is tied to a support. 606 of the pendulum is held at a side and released. It starts moving in a to and fro motion. This is called an oscillatory motion. The time taken by the pendulum to domplete one oscillation is called time period. This time period is always same with a pendulum having same length of the string.

The string of the pendulum is adjusted to the length, that is completes one oscillation in second and it keeps on moving the clockgiving us time. It has been found that pendulum of about 25 cm length takes exactly on second to comple te one oscillation.
6. Describe various metfods used to measure time in earlier days.

There were no electronic watches in earlier days. Sunset time was a little bit difficult proportion. The earliest method of measuring time was based on the position of the sun. the sundials were used for this purpose. Time was measured by the shadow cast by the changing position of the sun form day to night. Chine made a were clock 6000 years ago. Sand clock was also used to measure time. sand clock was used by Romans. The time taken by sand to fall into the lower chamber form the upper chamber was considered to be the unit of measuring time. The discovery of pendulum helped in determining the exact time before the electronic watches were invented.
7. Distance between bholu's and Golu's fouse is 9 Km . Bholu has to attend Glu's birthday at 7'o Clock. He started from his home at 6 o 's clock on his bicycle and covered a distance at 6 km in 40 minutes. at that point he met chintu and he spoke to fim for 5 minutes and reached Golu's birthday party at7'o clock. With what speed did he cover the second part of the journey? Calculate his average speed for the entire journey.

Bholu's covers 3 km in 15 min

$$
\text { Speed } \quad=\quad \frac{3}{15} \times 6012 \mathrm{~min}=\frac{1}{60} \hbar 12 \mathrm{~km} / \mathrm{n}
$$

Average speed $=\frac{\text { Toatal distance travelled }}{\text { Total time taken }}$

8. Given below is figure of the distance-time graph or the motion an object.

i. What will be the position of the object at 20 s ?
ii. What will be the distance travelled by the object in 12 s?
iii. What is the average speed of the object?
i. From the graph, it is clear that the distance at 20 s is 8 m .
ii. Distance Travelled by the object in 12 s is 6 m .
iii. Ave rage speed $=\frac{\text { Total distance }}{\text { Total time }}$

$$
\begin{aligned}
& =\frac{8}{20} \\
& =0.4 \mathrm{~m} / \mathrm{s} .
\end{aligned}
$$

## I. Long Answer type question.

1. Aman made a graph to show the relationship between the speed of a car and time.

Look at the graph and answer the following questions:
i. What fas Aman shown on each axis?
ii. What is the scale of the graph?
iii. What is the speed of the car at 3.30 minutes?
iv. What distance is covered by the car in 4 minutes?
v. At what time the car has assumed constant speed?
i. Time in minutes on $x$-axis and speed in $m / m$ in on $y$-axis.
ii. On $X$-axis, 10 divisions $=1 \mathrm{~min}$ and on $y$-axis 10 divisions $=25 \mathrm{~m} / \mathrm{min}$
iii. At 3.030 minutes, the speed of car is $30 \mathrm{~m} / \mathrm{min}$.
iv. Distance at 4 min $=$ Speed $x$ time

$$
=\quad 52.5 \times 4=210.0 \mathrm{~m} .
$$

v. After 6.30 minutes the car has assumed constant speed.
2. i. How can we choose a suitable scaled to draw a distance-time graph? Explain by giving example.
ii. which are the uses of distance- time grapk?
i. We should keep the following points in mind while choosing the most suitable scale for drawing a grapf:
a. The difference between the highest and lowest values of each quantity.
6. The intermediate values of each quantity, so that with the scale chosen, it is convenient to mark the values on the graph.
c. To utilize the maximum part of the paper on which the graph is to be drawn. Suppose that we have a graph paper of size $25 \mathrm{~cm} x 25 \mathrm{~cm}$ and we have to accommodate following data.

| Time (a.m) | Odometer reading | Distance from the starting point |
| :---: | :---: | :---: |
| $8: 00 \mathrm{a} . \mathrm{m}$ | 36540 km | 0 km |
| $8: 30 \mathrm{a} . \mathrm{m}$ | 36560 km | 20 km |
| $9: 00 \mathrm{a} . \mathrm{m}$ | 36580 km | 40 km |
| $9: 30 \mathrm{a} . \mathrm{m}$ | 3600 km | 60 km |
| $10: 00 \mathrm{a} . \mathrm{m}$ | 36620 km | 80 km |

One of the scales will be;
Distance : $5 \mathrm{~km}=1 \mathrm{~cm}$ and
Time : $6 \mathrm{~min}=1 \mathrm{~cm}$

ii. Importance of distance-time graph: From the graph, we canfind the distance moved by the bus at any instant of time, not given in the table. For example, we want to know the distance covered. Up to 9.15 a.m on the $\chi$-axis. Let it be $\mathcal{A}$. Next draw a line perpendicular to $\chi$ axis at $\mathcal{A}$. Let it intersects the distance time graph line at $\mathcal{T}$. Next draw a line through $\mathcal{T}$ parallel to $\chi$-axis. Let it intersects the $y$-axis at $\mathcal{B}$. The distance corresponding to point $\mathcal{B}$ on the Y-axis gives the distance covered by the car up to 9.15 a.m this is 48 km .
3. Describe steps to construct a graph using the data given in the following table.

| $\mathcal{S} \mathcal{N}(o$ | Time (minutes) | Distance $(\mathrm{km})$ |
| :---: | :---: | :---: |
| 1. | 0 | 0 |
| 2. | 5 | 606 |
| 3. | 15 | 20 |
| 4. | 30 | 40 |
| 5. | 60 | 60 |
| 6. | 80 |  |

The following steps may be followed:
i. Draw two perpendicular line to represent the two axis and mark them $O X \mathcal{A N} \mathcal{D} O \mathcal{Y}$. $O$ is the intersection of the two axis.
ii. Decide the quantity to be shown along the $y$-axis. From the given date, we are measuring distance at given intervals of time. So time it to be shown along x-axis distance along $y$-axis.
iii. Choose a scale to represent the given data. Suppose we have 4 (or 40 divisions along $y$-axis. Along $x$-axis and 4 squares (or 40 divisions along $y$-axis. Along $x$-axis we can take 10 divisions equal to 15 min and along $y$-axis we can take 10 divisions equal to 20 km .
iv. Mark the values of time and distance on the respective axis.
v. Now mark points on the graph paper to represent each set of values for distance and time.
vi. I oin all points on the grapf. Grapf obtained is shown below.

4. a. Define speed.
6. The distance between $\mathcal{D e}$ 作i and $\mathcal{A g r a}$ is 270 km . A train takes 3 hours to cover the distance. calculate the speed of train.
c. Show the shape of distance-time graph for veficle moving with a constant speed.
a. The total distance covered in given interval of time is known as speed.
6. Distance between Delfi \&Agra $=270 \mathrm{~km}$

Time taken by train $=3$ fours
Sped = Distance $/$ time

## $O=270 / 3=90 \mathrm{~km} / \mathrm{kr}$.

c. Distance - Time graph

Distance - Time graph

II. Long Answer type question.

1. Complete the following table:

Table 13.3 Som examples of different types of motion

| Examples of motion | Types of motion along a straight line <br> /circular/periodic |
| :--- | :--- | :--- |
| Soldiers in a march past Bullock cart  <br> moving on a straight road hands of an  <br> athlete in a race  <br> Pedal of a bicycle in motion  <br> Motion of the earth around the sun  <br> Motion of a swing  <br> Motion of a pendulum  |  |

| Examples of motion | Types of motion along a straight line /circular/periodic |
| :---: | :---: |
| oldiers in a march past <br> Bullock cart moving on a straight road <br> Hands of an athlete in a race <br> Pe dal of a bicycle in motion <br> Motion of the earth around the sun <br> Motion of a swing <br> Motion of a pendulum | Straight line <br> Straight line <br> Periodic <br> Circular <br> Circular and Periodic <br> Periodic <br> Periodic |

2. What is a simple pendulum? Explain fow does it perform oscillatory motion.
$\mathcal{A}$ Simple pendulum consists of a small metallic ball or a piece of stone suspended from a rigid stand by a thread. The metallic ball is called ob of the pendulum.

When the bob of the pendulum is released after taking it slightly one side, it starts to move to and fro. The to and fro motion of a simple pendulum is an example of an oscillatory motion.
3. Look at the graph and answer the following question:
i) What is shown on each axis?
ii) What is the scale?
iii) What is the volume of the cube whose side is 4 cm ?
iv) Can you find the volume of a cube or side 6 cm by extending graph?

i) Side of a cube is shown on $x$-axis and the volume on $y$-axis
ii) Scale on $x$-axis 1 unit $=1 \mathrm{~cm} \mathcal{Y}$ axis $/$ Unit $=25 \mathrm{~cm}^{3}$
iii) The volume of the cube whose side is $4 \mathrm{~cm}=64 \mathrm{~cm}^{3}$
iv) Yes, we can find out the volume.
4. Describe the steps to construct a graph with the help of following data

Table 13.4: The motion of a car

| $\mathcal{S} . \mathcal{N} o$. | Time | Distance |
| :---: | :---: | :---: |
| 1 | 0 | 0 |
| 2 | 1 min | 1 km |
| 3 | 2 min | 2 km |
| 4 | 3 min | 3 km |
| 5 | 4 min | 4 km |
| 6. | 5 min | 5 km |

We can make the graph by using following steps:
i) Draw two perpendicular lines to represent the two axes and mark them as $O X$ and $O \mathcal{Y}$
ii) $\mathcal{D e c i d e ~ t h e ~ q u a n t i t y ~ t o ~ s h o w ~ a l o n g ~ t h e ~} x$ and $y$-axis. In this case we show time along the $x$-axis and the distance along the $y$-axis.
iii) Choose a scale to represent the distance and time on $y$-axis and $x$-axis respectively.
iv) Mark the value of time and distance on the respective axes according to the scale chosen.
v) Now mark the points on the graph. This is the distance-time graph for the motion of the car.
vi. I oin all the points on the graph. This is the distance-time graph for the motion of the car.

Fig. $13.17 x$-axis and $y$-axis on a graph paper.

5. Write importance of distance -time grapk
i) Distance - time graph provides a variety of information about motion
ii) We can find the distance moved any the body at any instant of time
iii) It shows whether motion is uniform or non-uniform
iv) It tells us that motion is accelerated or retarded.
III. Long Answer type question.

1. Given below as figure is the distance-time graph of a motion of an object.
( $N(C E R T$ Exemplar)

a. What will be the position of the object at 20 s ?
2. What will be the distance travelled by the object in 12 s ?
c. What is the average speed of the object?
a. 8 m from the starting point.
6.6 m
c. $\mathcal{A v e}$ rage speed $=\frac{\text { Total distance travelled }}{\text { Total time taken }}$

$$
=\frac{8 \mathrm{~m}}{20 \mathrm{~s}}=0.4 \mathrm{~m} / \mathrm{s}
$$

2. The odometer of a car reads 57321.0 km when the clock shows the time 08.30 a.m. What is the distance moved by the car, if at 8.50 a.m., the odometer reading fas changed to 57336.0 km ? Calculate the speed of the car in $\mathrm{km} / \mathrm{min}$ during this time. Express the speed in $k m / h$ also.

Initial reading of the odometer of the car $=57321.0 \mathrm{~km}$
Final reading of the odometer of the car $=57336.0 \mathrm{~km}$
Distance covered by the car = Final reading of the odometer of the car - Initial reading of the odometer of the car $=57336.0-57321.0=15 \mathrm{~km}$

The given car starts at 8.30 a.m. and stops at 8.50 am
Therefore, time taken by the car to cover the distance is (8.50-830) $\mathrm{min}=20 \mathrm{~min}$
Distance covered by the car $=15 \mathrm{~km}$
Time taken by the car $=20 \mathrm{~min}$

$$
\begin{aligned}
\text { Speed } & =\frac{\text { Distance covered }}{\text { Time taken }} \\
& =\frac{15}{20}=0.75 \mathrm{~km} / \mathrm{min}
\end{aligned}
$$

Again, $\quad 60 \mathrm{~min}=1 \mathrm{f}$

$$
20 \mathrm{~min}=\frac{1}{60} \times 20=\frac{1}{3} h
$$

Time taken by the car $=\frac{1}{3} h$

$$
\begin{aligned}
\text { Speed } & =\frac{\text { Distance covered }}{\text { Time taken }} \\
& =\frac{15}{1 / 3}=45 \mathrm{~km} / \mathrm{h}
\end{aligned}
$$

3. With the help of an activity, explain how will you measure the time period of a simple pendulum.

Activity:
$>$ Suspended a metallic ball (6o6) by a long thread from a rigid support. Your simple pendulum is ready.

Set the simple pendulum in motion.
$>\mathcal{N}$ ote the time in your watch when 606 is at an extreme position (say $\mathcal{A}$ ).
$>$ When the bob again comes to the position $\mathcal{A}$, count 1 (one). Each time the bob reaches this position (A), increase the count by 1(one).
$>$ Check the time after 25 such oscillations. Find the time taken in 25 oscillations.
I. High order thinking Skills (Hots) Question.

1. A stone is dropped from the a height of 20 m above the ground. Will it have a uniform or non- uniform speed, as it moves towards the gorund?

A free falling body moves with constant speed, e., speed of earth gravity. Thus, the stone will have a uniform motion.
I. Value Based Question

1. Two railway station are 320 km apart from each other. Train- I covers this distance in 4.5 fours whereas train -II reaches the destination 10 minutes earlier.

Based on this information answer the following questions:
i. What might be the reason that the train -II reaches the destination earlier?
ii. Calculate the speed of both the trains.
iii. if we consider that both the trains move with constant speed, then assign one distance-time constant speed, then assign one distance - time graph for each train.

## graph for each train.

i. Train - II might have gone in figher speed then the train - I as it takes less time to cover the same distance.
ii. For train -I

$$
\begin{aligned}
\text { Distance } & =320 \mathrm{~km} \\
\text { Time Taken } & =4 \hbar 30 \mathrm{mins} \\
& =4 \frac{1}{2} \mathrm{~h} \\
\text { Speed } & =\frac{\text { Distance }}{\text { Time }} \\
& =\frac{320}{9 / 2} \mathrm{~km} / \mathrm{h} \\
& =\frac{320 \times 2}{9}=\frac{640}{9} \\
& =71.1 \mathrm{~km} / \mathrm{h}
\end{aligned}
$$

For train - II

$$
\text { Distance }=320 \mathrm{~km}
$$

time taken $=30 \mathrm{mins}$ less than the first train

$$
\begin{aligned}
& =4 \mathrm{~h} \\
\text { Speed } & =\frac{\text { Distance }}{\text { Time }} \\
& =\frac{320}{4} \mathrm{~km} / \mathrm{h} \\
& =80 \mathrm{~km} / \mathrm{h}
\end{aligned}
$$

iii. The graph in figure (a) is of train $-I$

The graph in figure (6) is of train-II.

> Skill Based Que stions.

1. Draw a diagram of (a) wall clock (b) table clock (c) digitalclock. On what principle do all clocks work?

(a) Wall clock

(b) Table clock

(c) Digital clock
2. Observe the following figures and identify them

a) Sundial at Jantar Mantar, Delfi
6) Sandalclock
c) Water clock
3. a) observe the following figure and identify it.

6) Write the functions of them
a) This figure shows the dashboard of acar. It consist of two types of meter
i) Speedometer
ii) Odometer
7) In function of speedometer is to measure the speed of the veficle directly in $k m / \hbar$. The odometer is used to measure the total distance moved by the veficle
4. Draw a Bar Grapf by the following data of marks got by a student in different
subjects.
5. $\operatorname{Hind} i-60$
6. Science-55

7. Maths -40

8. Socialscience - 50

Cross word Puzzle
9. 

1. An instrument on motor veficle, etc. indicating its speed.
2. It is a Greekword meaning indicator.
3. The S I unit of time.
4. Time taken by a pendulum to complete one oscillation.
5. A substance whose crystals can vibrate veryfast and at a very precise rate.

## Down

1. An instrument showing the time by the shadow of a pointer cast by the sun onto a graduated plate.
2. The SI unit of length.
3. A diagram showing the relation between two variable quantities, each measured along one of a pair of axes.
4. The metallic ball used in a pendulum.
5. An instrument that measures the distance moved by the veficle.
6. The Siunit of mass

Across

1. speedometer
2. second
3. quartz

Down

1. sundial
3.graph
2. odometer
3.gnomon
3. time period
2.meter
4. 606
5. Kilogram
