

GRADE - 9

LESSON – 9 Areas of Parallelograms and Triangles

Objective Type Questions

I. Multiple choice questions

- Two figures are congruent, if they have the
 - same size
 - same shape
 - same area
 - same shape and size
- If A and B are two congruent figures, then
 - $\text{ar}(A) > \text{ar}(B)$
 - $\text{ar}(A) = \text{ar}(B)$
 - $\text{ar}(A) < \text{ar}(B)$
 - none of these
- Given parallelogram ABCD and EBCF on the same base BC and between the same parallels BC and AF. Given $\text{ar}(EBCF) = 15 \text{ square cm}$, then $\text{ar}(ABCD)$ is
 - 30 sq.cm
 - 7.5 sq.cm
 - 15 sq.cm
 - 5 sq.cm

Sol : Parallelograms on the same base and between the same parallels are equal in area.

$$\Rightarrow \text{ar}(ABCD) = \text{ar}(EBCF)$$

Since $\text{ar}(EBCF) = 15 \text{ sq.cm}$, so

$$\text{ar}(ABCD) = 15 \text{ sq.cm}$$

\therefore Correct option is (c)

- If $\text{ar}(\text{Parallelogram } ABCD) = 25 \text{ cm}^2$ and on same base CD a $\triangle BCD$ is given such that $\text{ar}(\triangle BCD) = x \text{ cm}^2$ then value of x is
 - 25 cm^2
 - 12 cm^2
 - 12.5 cm^2
 - 50 cm^2

Sol : If a triangle and a parallelogram are on the same base and between the same parallels, then the area of the triangle is equal to half the area of the parallelogram.

$$\Rightarrow \text{ar}(\triangle BCD) = \frac{1}{2} \text{ar}(ABCD)$$

$$\Rightarrow x = \frac{1}{2} \times 25 \Rightarrow x = 12.5 \text{ cm}^2$$

\therefore Correct option (c)

5. Two parallelograms are on equal bases and between the same parallels. The ratio of their areas is
[NCERT Exemplar]

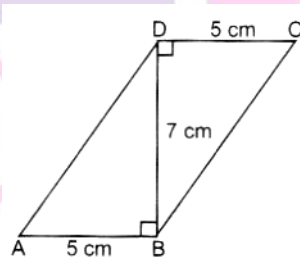

a) 1 : 2 b) 1 : 1 c) 2 : 1 d) 3 : 1

Sol : (b)

6. ABCD is a quadrilateral whose diagonal AC divides it into two parts, equal in area, then ABCD
[NCERT Exemplar]

a) is a rectangle
b) is always a rhombus
c) is a parallelogram
d) need not be any of (a), (b), or (c)
(d)

7. In the given figure, ABCD is parallelogram. Calculate the area of parallelogram ABCD.

Sol : Area of parallelogram ABCD

= base \times altitude = AB \times DB

= 5 \times 7 = 35 cm^2

8. Find the area of a rhombus, the length of whose diagonals are 16cm and 12cm respectively.

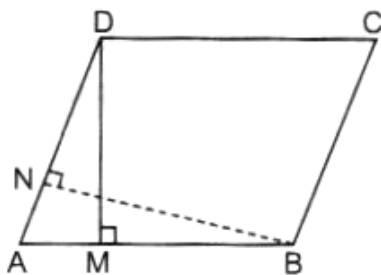

Sol : Area of rhombus = $\frac{1}{2} \times d_1 \times d_2$

= $\frac{1}{2} \times 16 \times 12 \text{ cm}^2$

= 96 cm^2

Next Generation School

9. In parallelogram ABCD, AB = 8 cm and the altitudes corresponding to sides AB and AD are DM = 6 cm and BN = 10 cm respectively. Find AD.

Sol : Area of parallelogram = base \times altitude

$$\therefore AD \times BN = AB \times DM$$

$$AD \times 10 = 8 \times 6$$

$$AD = \frac{8 \times 6}{10} = \frac{48}{10} = 4.8 \text{ cm}$$

II. Multiple choice questions

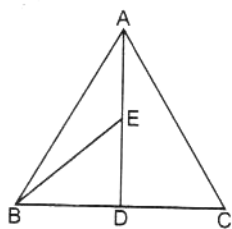

1. Given a triangle ABC and E is mid-point of median AD of $\triangle ABC$. If $\text{ar}(\triangle BED) = 20 \text{ cm}^2$. Then $\text{ar}(\triangle ABC)$ is.

a) 10 cm^2

b) 5 cm^2

c) 60 cm^2

d) 80 cm^2

Sol : Since BE is the median of $\triangle ABD$, so

$$\text{ar}(\triangle BED) = \frac{1}{2} \text{ar}(\triangle ABD)$$

$$\Rightarrow 20 = \frac{1}{2} \text{ar}(\triangle ABD)$$

$$\Rightarrow \text{ar}(\triangle ABD) = 40 \text{ cm}^2$$

Since AD is the median of $\triangle ABC$, so

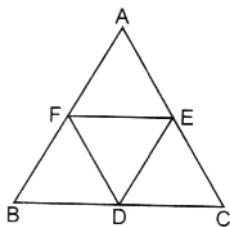

$$\text{ar}(\triangle ABC) = 2\text{ar}(\triangle ABD)$$

$$\Rightarrow \text{ar}(\triangle ABC) = 2 \times 40 = 80 \text{ cm}^2$$

\therefore Correct option is (d)

2. The mid-point of the sides of a triangle along with any of the vertices as fourth point make a parallelogram of area equal to half area of triangle

a) True b) False

Sol: We have

$$\text{ar}(\triangle DEF) = \frac{1}{4} \text{ar}(\triangle ABC)$$

$$\text{Now, ar}(BDEF) = \text{ar}(\triangle DEF) + \text{ar}(\triangle FBD)$$

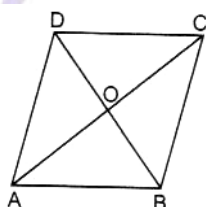

$$= 2 \text{ar}(\triangle DEF)$$

$$= 2 \times \frac{1}{4} \text{ar}(\triangle ABC)$$

$$= \frac{1}{2} \text{ar}(\triangle ABC)$$

\therefore correct option is (a).

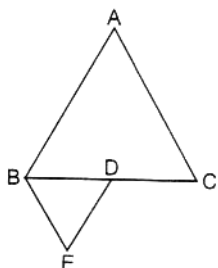

3. In the given figure, ABCD is a parallelogram in which diagonals AC and BD intersect at O. If $\text{ar}(\text{llgm ABCD})$ is 68 cm^2 , then find $\text{ar}(\triangle OAB)$.

$$\text{Sol: We have } \text{ar}(\triangle OAB) = \frac{1}{4} \times \text{ar}(\text{llgm ABCD})$$

$$= \frac{1}{4} \times 68 \text{ cm}^2 = 17 \text{ cm}^2$$

4. ABC and BDE are two equilateral triangles such that D is the mid-point of BC. Prove that $\text{ar}(\triangle BDE) = \frac{1}{4} \text{ar}(\triangle ABC)$

Sol: Let the side of triangle, $BC = a$

$$\Rightarrow BD = \frac{a}{2}$$

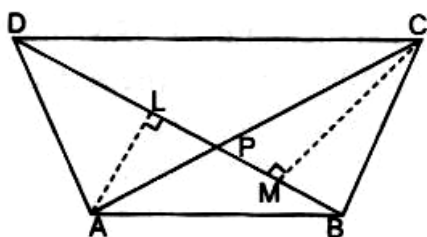

$$\therefore \text{ar}(\Delta BDE) = \frac{\sqrt{3}}{4} \left(\frac{a}{2}\right)^2 = \frac{\sqrt{3}}{4} \times \frac{a^2}{4}$$

$$= \frac{1}{4} \left(\frac{\sqrt{3}}{4} \times a^2\right)$$

$$\therefore \text{ar}(\Delta BDE) = \frac{1}{4} \text{ar}(\Delta ABC). \quad \text{Hence proved.}$$

I. Short answer questions

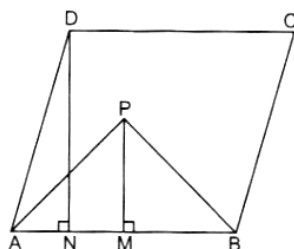

1. Diagonals AC and BD of a quadrilateral ABCD intersect each other at P. Show that $\text{ar}(\Delta APB) \times \text{ar}(\Delta CPD) = \text{ar}(\Delta APD) \times \text{ar}(\Delta BPC)$

Sol. We have

$$\begin{aligned} & \text{ar}(\Delta APD) \times \text{ar}(\Delta BPC) \\ &= \left(\frac{1}{2} \times AL \times DP\right) \times \left(\frac{1}{2} \times CM \times BP\right) \\ &= \left(\frac{1}{2} \times BP \times AL\right) \times \left(\frac{1}{2} \times DP \times CM\right) \\ &= \text{ar}(\Delta APB) \times \text{ar}(\Delta CPD) \quad \text{Hence Proved.} \end{aligned}$$

2. If P is any point in the interior of a parallelogram ABCD, then prove that area of (ΔAPB) is less than half the area of the parallelogram

Sol. Given: P is any point in the interior of parallelogram ABCD

To prove : $\text{ar}(\triangle APB) < \frac{1}{2} (\text{ar } \parallel\text{gm ABCD})$

Construction: Draw $DN \perp AB$ and $PM \perp AB$.

Proof : $\text{ar}(\parallel\text{gm ABCD}) = AB \times DN$

$$\text{ar}(\triangle APB) = \frac{1}{2} (AB \times PM)$$

Now, $PM < DN$

$$\Rightarrow AB \times PM < AB \times DN$$

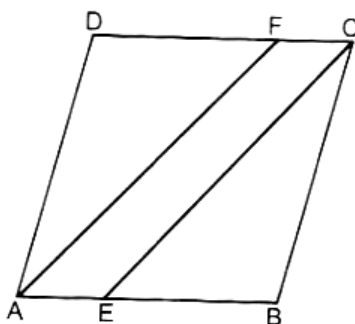

$$\Rightarrow \frac{1}{2} (AB \times PM) < \frac{1}{2} (AB \times DN)$$

$$\Rightarrow \text{ar}(\triangle APB) < \frac{1}{2} \text{ar}(\parallel\text{gm ABCD})$$

Hence proved

II. Short answer questions

1. ABCD is a parallelogram. E is a point on BA such that $BE = 2EA$ and F is a point on DC such that $DF = 2FC$. Prove that AECF is a parallelogram whose area is one-third of the area of parallelogram ABCD.

Sol. Given : A parallelogram ABCD. E is a point on BA $\ni BE = 2EA$ and F is a point on DC such that $DF = 2FC$.

To prove: (i) AECF is a parallelogram.

$$(ii) \text{ar}(\parallel\text{gm AECF}) = \frac{1}{3} \text{ar}(\parallel\text{gm ABCD})$$

Proof : $BE = 2EA$ and $DF = 2FC$

$$\Rightarrow AB - AE = 2AE \text{ and } DC - FC = 2FC$$

$$\Rightarrow AB = 3AE \text{ and } DC = 3FC$$

$$\Rightarrow AE = \frac{1}{3}AB \text{ and } FC = \frac{1}{3}DC$$

$$\Rightarrow AE = FC \quad (\because AB = DC)$$

$\therefore AE \parallel FC$ such that $AE = FC$

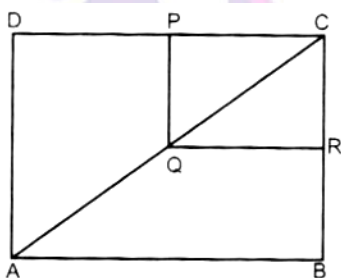

$\therefore AEFC$ is a parallelogram.

Parallelograms $ABCD$ and $AECF$ have the same altitude and $AE = \frac{1}{3}AB$

$$\therefore \text{ar}(\parallel \text{gm } AECF) = \frac{1}{3} \text{ar}(\parallel \text{gm } ABCD)$$

Hence proved.

3. $ABCD$ and $PQRC$ rectangles. Q is mid-point of AC . Show that P is the mid-point of DC and R is the mid-point of BC . Also, find the ratio of $\text{ar}(ABCD)$ and $\text{ar}(PQRC)$

Sol. Given : $ABCD$ and $PQRC$ are rectangles. Q is mid-point of AC

To prove : P, R are mid-points of DC, BC respectively and find $\text{ar}(ABCD) : \text{ar}(PQRC)$

Proof : In $\triangle CAB$, Q is the mid-point of AC .

$$QR \parallel AB$$

($\because ABCD$ and $PQRC$ both are rectangles)

$\Rightarrow R$ is the mid-point of BC . (By converse of mid-point theorem)

Again in $\triangle CAB$, Q and R are the mid-points of AC and BC respectively.

$$\Rightarrow QR = \frac{1}{2}AB \text{ (By mid-point theorem)}$$

$$\Rightarrow QR = \frac{1}{2}DC$$

($\because AB = DC$, Opposite sides of a rectangle)

In $\triangle CAD$, Q is the mid-point of AC .

Again, $PQ \parallel DA$

$\Rightarrow P$ is the mid-point of DC

(By converse of mid-point theorem)

Again in $\triangle CAD$, Q and P are the mid-points of AC and DC respectively

$$\Rightarrow PQ = \frac{1}{2} DA \text{ (By mid-point theorem)}$$

$$\Rightarrow PQ = \frac{1}{2} CB \text{ ----(ii)}$$

($\because DA = CB$, opposite sides of a rectangle)

$$\text{Now, ar (ABCD) = DC X CB \text{ -----(iii)}}$$

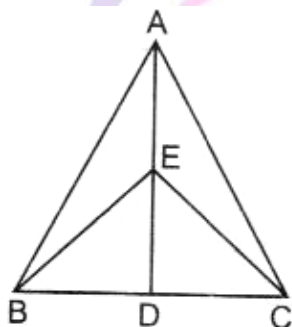

$$\begin{aligned} \text{ar (PQRC)} &= QR \times PQ = \left(\frac{1}{2} DC\right) \times \left(\frac{1}{2} CB\right) \\ &= \frac{1}{4} DC \times CB = \frac{1}{4} (\text{ar ABCD}) \end{aligned}$$

$$\Rightarrow \frac{\text{ar (PQRC)}}{\text{ar (ABCD)}} = \frac{1}{4} \text{ i.e. } = 1:4$$

Hence, $\text{ar (PQRC)} : \text{ar (ABCD)} = 1:4$

III. Short answer questions

1. D and E are the mid-points of BC and AD respectively of $\triangle ABC$. If area of $\triangle ABC = 20\text{cm}^2$ find area of $\triangle EBD$.

Sol. \because D is the mid-point of BC

\therefore AD is the median of $\triangle ABC$

$$\Rightarrow \text{ar} (\triangle ABD) = \frac{1}{2} \text{ar} (\triangle ABC)$$

(\because Median of a triangle divides it into two triangles of equal areas)

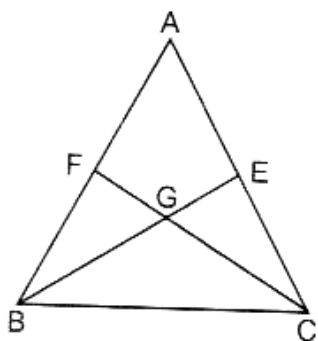

$$\Rightarrow \text{ar} (\triangle ABD) = \frac{1}{2} \times 20\text{cm}^2 = 10\text{cm}^2$$

Also, BE is the median of $\triangle ABD$.

$$\text{ar} (\triangle EBD) = \frac{1}{2} \text{ar} (\triangle ABD) = \frac{1}{2} \times 10 = 5\text{cm}^2$$

2. The medians BE and CF of a $\triangle ABC$ intersect at G. Prove that $\text{ar}(\triangle GBC) = \text{ar}(\triangle AGE)$

Sol. Given : Medians BE and CF of $\triangle ABC$ intersect at G.

To prove : $\text{ar}(\triangle GBC) = \text{ar}(\triangle AGE)$

Proof : We have $\text{ar}(\triangle FBC) = \frac{1}{2} \text{ar}(\triangle ABC)$ -----(i)

(\because Median CF divides $\triangle ABC$ into two triangles of equal areas)

Similarly, $\text{ar}(\triangle EBC) = \frac{1}{2} \text{ar}(\triangle ABC)$ -----(ii)

From (i) and (ii) we get

$$\text{ar}(\triangle FBC) = \text{ar}(\triangle EBC) \text{ ----(iii)}$$

Subtracting $\text{ar}(\triangle BGC)$ from both sides of (iii), we get

$$\text{ar}(\triangle FBC) - \text{ar}(\triangle BGC) = \text{ar}(\triangle EBC) - \text{ar}(\triangle BGC)$$

$$\Rightarrow \text{ar}(\triangle FGB) = \text{ar}(\triangle EGC) \text{ ---(iv)}$$

Also, $\text{ar}(\triangle ABE) = \text{ar}(\triangle BEC)$

(\because BE is median of $\triangle ABC$)

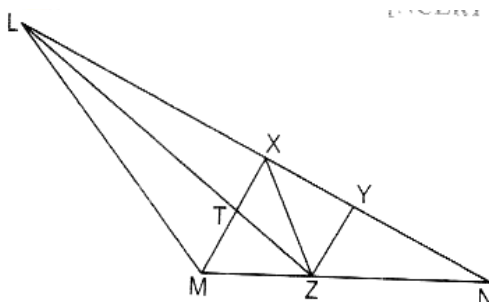

$$\Rightarrow \text{ar}(\triangle BFG) + \text{ar}(\triangle AGE) = \text{ar}(\triangle BGC) + \text{ar}(\triangle GEC)$$

$$\Rightarrow \text{ar}(\triangle AGE) = \text{ar}(\triangle BGC)$$

Using (iv)

Hence proved

3. In the given figure, X and Y are point on side LN of the $\triangle LMN$ such that $LX = XY = YN$. Through X, a line is drawn parallel to LM to meet MN at Z. Prove that $\text{ar}(\triangle LZY) = \text{ar}(\triangle MZYX)$

Sol. Given : $LX = XY = YN$. And $XZ \parallel LM$

To prove : $\text{ar}(\Delta LZY) = \text{ar}(\Delta MZYX)$

Proof : $XZ \parallel LM$

ΔLXZ and ΔXMZ are on the same base XZ and between the same parallels XZ and LM .

$$\therefore \text{ar}(\Delta LXZ) = \text{ar}(\Delta XMZ)$$

Adding $\text{ar}(\Delta XYZ)$ on both sides we get

$$\text{ar}(\Delta LXZ) + \text{ar}(\Delta XMZ)$$

Adding $\text{ar}(\Delta XYZ)$ on both sides, we get

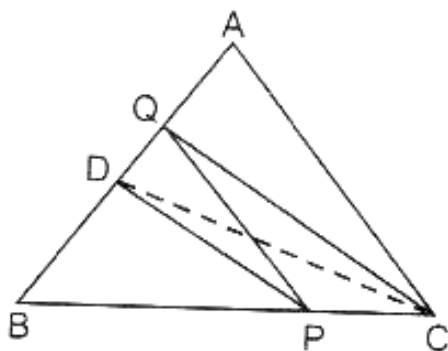

$$\text{ar}(\Delta LXZ) + \text{ar}(\Delta XYZ) = \text{ar}(\Delta XMZ) + \text{ar}(\Delta XYZ)$$

$$\therefore \text{ar}(\Delta LZY) = \text{ar}(\Delta MZYX)$$

Hence proved.

IV. Short answer questions

4. In ΔABC , D is the mid-point of AB and P is any point on BC . If $CQ \parallel PD$ meets AB in Q in the given figure, then prove that $\text{ar}(\Delta BPQ) = \frac{1}{2} \text{ar}(\Delta ABC)$ [NCERT Exemplar]

Sol: Given A ΔABC , D is the mid-point of AB and P is any point on BC and $CQ \parallel PD$ meets AB in Q

To prove: $\text{ar}(\Delta BPQ) = \frac{1}{2} \text{ar}(\Delta ABC)$

Construction: Join D and C

Proof : since CD is the median of ΔABC .

$$\therefore \text{ar}(\Delta BCD) = \frac{1}{2} \text{ar}(\Delta ABC)$$

(\because Median of a triangle divides it into two triangles of equal areas)(i)

$DP \parallel CQ$

[Given]

$$\therefore \text{ar}(\triangle DPQ) = \frac{1}{2} \text{ar}(\triangle DPC)$$

[Triangles are on the same base DP and between the same parallels DP and CQ]

Adding $\text{ar}(\triangle DBP)$ on both sides, we get

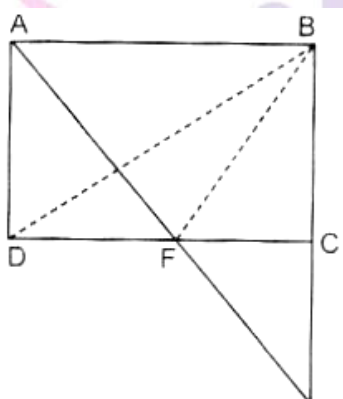

$$\text{ar}(\triangle DPQ) + \text{ar}(\triangle DBP) = \text{ar}(\triangle DPC) + \text{ar}(\triangle DBP)$$

$$\Rightarrow \text{ar}(\triangle BPQ) = \text{ar}(\triangle BCD) \quad \text{.....(ii)}$$

From (i) and (ii), we get

$$\text{ar}(\triangle PQB) = \frac{1}{2} \text{ar}(\triangle ABC) \quad \text{Hence proved.}$$

5. In the given figure. ABCD is a parallelogram in which BC is produced to E such that $CE = BC$, AE intersects CD at F, If area of $\triangle BDF = 3\text{cm}^2$ Find the area of parallelogram ABCD

Sol. In $\triangle ADF$ and $\triangle ECF$,

$$\angle ADF = \angle ECF \quad [\text{Alternate interior angles}]$$

$$AD = CE \quad (\because AD = BC \text{ and } BC = CE)$$

$$\angle DFA = \angle CFE \quad (\text{Vertically opposite angles})$$

$$\triangle ADF \cong \triangle ECF \quad (\text{AAS congruence rule})$$

$$\Rightarrow \text{ar}(\triangle ADF) = \text{ar}(\triangle ECF)$$

$$\text{Also } DF = CF \quad (\text{CPCT})$$

\therefore F is the mid-point of DC

\Rightarrow BF is the median in $\triangle BCD$

$$\Rightarrow \text{ar}(\triangle BCD) = 2\text{ar}(\triangle BDF)$$

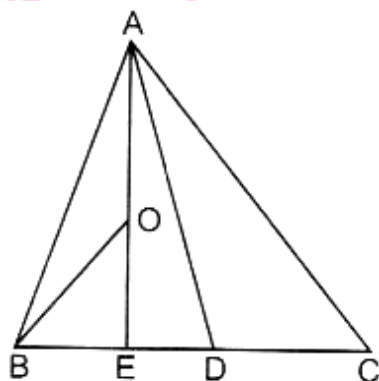

(\because Median of a triangle divides it into two triangles of equal areas)

$$\Rightarrow \text{ar} (\triangle BCD) = 2 \times 3 \text{ cm}^2 = 6 \text{ cm}^2$$

$$\therefore \text{ar} (\text{|| gm } ABCD) = 2 \text{ar} (\triangle BCD)$$

$$= (2 \times 6) \text{ cm}^2 = 12 \text{ cm}^2$$

6. D is the mid-point of side BC of $\triangle ABC$ and E is the mid-point of BD. If O is the mid-point of AE then prove that $\text{ar} (\triangle BOE) = \frac{1}{8} \text{ar} (\triangle ABC)$

Sol. Given : D, E and O are mid-points of BC, BD and AE respectively

To prove : $\text{ar} (\triangle BOE) = \frac{1}{8} \text{ar} (\triangle ABC)$

Proof : since AD and AE are the medians of $\triangle ABC$ and $\triangle ABD$ respectively.

$$\therefore \text{ar} (\triangle ABD) = \frac{1}{2} \text{ar} (\triangle ABC) \quad \text{---(1)}$$

$$\text{and ar} (\triangle ABE) = \frac{1}{2} \text{ar} (\triangle ABD) \quad \text{---(2)}$$

Also, OB is the median of $\triangle ABE$

$$\therefore \text{ar} (\triangle BOE) = \frac{1}{2} \text{ar} (\triangle ABE) \quad \text{---(3)}$$

From (i), (ii) and (iii) we get $\text{ar} (\triangle BOE) = \frac{1}{2} \text{ar} (\triangle ABE)$

$$= \frac{1}{2} \times \frac{1}{2} \text{ar} (\triangle ABD)$$

$$= \frac{1}{4} \text{ar} (\triangle ABD)$$

$$= \frac{1}{4} \times \frac{1}{2} \text{ar} (\triangle ABC)$$

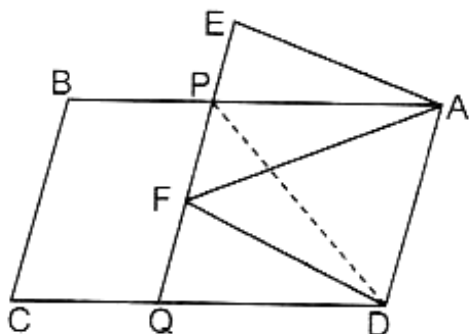

$$= \frac{1}{8} \text{ar} (\triangle ABC) \text{ Hence proved}$$

7. In the given figure, ABCD and AEFD are two parallelogram. Prove that

i) $PE = FQ$

ii) $\text{ar}(\triangle PEA) = \text{ar}(\triangle QFD)$

iii) $\text{ar}(\triangle APE) : \text{ar}(\triangle PFA) = \text{ar}(\triangle QFD) : \text{ar}(\triangle PFD)$

Sol. Given : ABCD And AEFD are two parallelograms

To prove :

i) $PE = FQ$

ii) $\text{ar}(\triangle PEA) = \text{ar}(\triangle QFD)$

iii) $\text{ar}(\triangle APE) : \text{ar}(\triangle PFA) = \text{ar}(\triangle QFD) : \text{ar}(\triangle PFD)$

Proof : i) In $\triangle APE$ and $\triangle DQF$

$\angle APE = \angle DQF$ (Corresponding angles)

$AE = DF$ (Opposite sides of a parallelogram)

$\angle AEP = \angle DFQ$ (Corresponding angles)

$\triangle APE \cong \triangle DQF$ (AAS congruence rule)

$\Rightarrow PE = QF$ (CPCT)

(ii) $\text{ar}(\triangle PEA) = \text{ar}(\triangle QFD)$ -----(i)

(\therefore Congruent triangles are equal in areas)

(iii) $\triangle PFA$ and $\triangle PFD$ are on the same base PF and between the same parallels PQ and AD

$\therefore \text{ar}(\triangle PFA) = \text{ar}(\triangle PFD)$ -----(2)

Dividing (i) by (ii), we get

$$\frac{\text{ar}(\triangle APE)}{\text{ar}(\triangle PFA)} = \frac{\text{ar}(\triangle QFD)}{\text{ar}(\triangle PFD)}$$

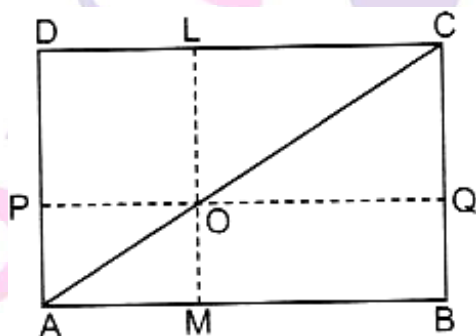

$$\Rightarrow \text{ar}(\triangle APE) : \text{ar}(\triangle PFA)$$

$$= \text{ar}(\triangle QFD) : \text{ar}(\triangle PFD)$$

Hence proved

I. Long answer questions

1. In the given figure, ABCD is a parallelogram. O is any point on AC. PQ \parallel AB and LM \parallel AD. Prove that $\text{ar}(\parallel \text{gm DLOP}) = \text{ar}(\parallel \text{gm BMOQ})$

Sol. Given : ABCD is a parallelogram and point O lies on AC. PQ \parallel AB and LM \parallel AD

To prove : $\text{ar}(\parallel \text{gm DLOP})$

$$= \text{ar}(\parallel \text{gm BMOQ})$$

Proof : \because Diagonal of a parallelogram divides it into two triangles of equal areas

$$\therefore \text{ar}(\triangle ADC) = \text{ar}(\triangle ABC)$$

$$\Rightarrow \text{ar}(\triangle APO) + \text{ar}(\parallel \text{gm DLOP}) + \text{ar}(\triangle LOC)$$

$$= \text{ar}(\triangle AOM) + \text{ar}(\parallel \text{gm BMOQ}) + \text{ar}(\triangle OQC) \quad \text{----(i)}$$

\because AO and OC are diagonals of parallelogram

AMOP and OQCL respectively

$$\therefore \text{ar}(\triangle APO) = \text{ar}(\triangle AMO) \quad \text{----(ii)}$$

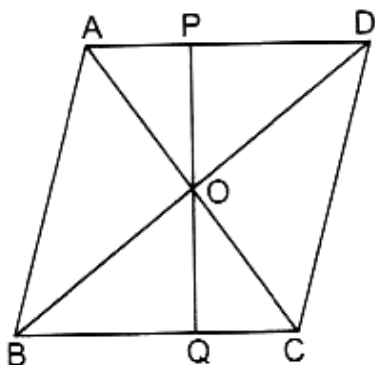

$$\text{ar}(\triangle OLC) = \text{ar}(\triangle OQC) \quad \text{----(iii)}$$

Subtracting (ii) and (iii) from (i) we get

$$\text{ar}(\parallel \text{gm DLOP}) = \text{ar}(\parallel \text{gm BMOQ})$$

Hence proved

2. The diagonals of a parallelogram ABCD intersect at a point O. Through O, a line is drawn to intersect AD at P and BC at Q. Show that PQ divides the parallelogram into two parts of equal area. [NCERT Exemplar]

Sol. Given : A parallelogram ABCD in which diagonals AC and BD intersect at O. Through O, a line is drawn to intersect AD at P and BC at Q.

To prove : $\text{ar}(\text{APQB}) = \text{ar}(\text{PQCD})$
 $= \frac{1}{2}(\text{ll gm ABCD})$

Proof : Diagonals of a parallelogram divide it into two triangles of equal area.

$$\text{ar}(\triangle ABC) = \text{ar}(\triangle ACD)$$

$$\text{ar}(\triangle ABQO) + \text{ar}(\triangle COQ) = \text{ar}(\triangle CDPQ) + \text{ar}(\triangle AOP) \text{-----(i)}$$

In $\triangle AOP$ and $\triangle COQ$, we have

$$\angle AOP = \angle COQ \quad (\text{Vertically opposite angles})$$

$$OA = OC \quad (\text{Diagonals of a parallelogram bisect each other})$$

$$\angle OAP = \angle OCQ \quad (\text{Alternate interior angles})$$

$$\therefore \triangle AOP \cong \triangle COQ \quad (\text{ASA congruence rule})$$

As congruent triangles are equal in areas,

$$\Rightarrow \text{ar}(\triangle AOP) = \text{ar}(\triangle COQ)$$

From (i) and (ii) we get

$$\text{ar}(\triangle ABQO) + \text{ar}(\triangle AOP) = \text{ar}(\triangle CDPQ) + \text{ar}(\triangle COQ)$$

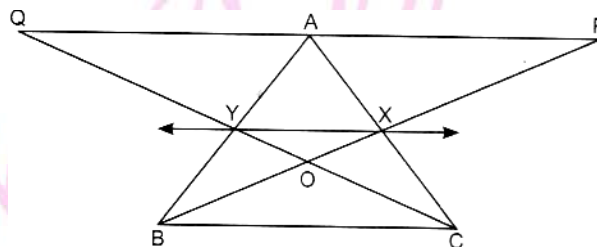

$$\text{ar}(\triangle ABQO) = \text{ar}(\triangle CDPQ)$$

$$\text{ar}(\text{APQB}) = \text{ar}(\text{PQCD})$$

Hence proved.

II. Long answer questions

1. In the given figure, X and Y are the mid-points of AC and AB respectively, $QP \parallel BC$ and CYQ and BXP are straight lines. Prove that $\text{ar}(\triangle ABP) = \text{ar}(\triangle ACQ)$

Sol. Given: X and Y are the mid-points of AC and AB respectively. $QP \parallel BC$ and CYQ and BXP are straight lines.

To prove: $\text{ar}(\triangle ABP) = \text{ar}(\triangle ACQ)$

Prove: X and Y are the mid-points of AC and AB respectively.

\therefore By mid-point theorem

$$XY \parallel BC$$

Triangles BYC and BXC are on the same base BC and between the same parallel XY and BC.

$$\therefore \text{ar}(\triangle BYC) = \text{ar}(\triangle BXC)$$

Subtracting $\text{ar}(\triangle BOC)$ from both sides, we get

$$\text{ar}(\triangle BYC) - \text{ar}(\triangle BOC) = \text{ar}(\triangle BXC) - \text{ar}(\triangle BOC)$$

$$\Rightarrow \text{ar}(\triangle BOY) = \text{ar}(\triangle COX)$$

Adding $\text{ar}(\triangle XOY)$ on both sides, we get

$$\text{ar}(\triangle BOY) + \text{ar}(\triangle XOY) = \text{ar}(\triangle COX) + \text{ar}(\triangle XOY)$$

$$\Rightarrow \text{ar}(\triangle BXY) = \text{ar}(\triangle CXY) \quad \dots\dots\dots (i)$$

\therefore Parallelogram XYAP and Parallelogram XYAQ are on the same base XY and between the same parallels XY and between the same parallels XY and PQ

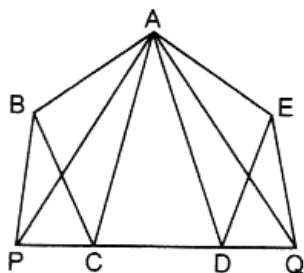

$$\therefore \text{ar}(\triangle XYAP) = \text{ar}(\triangle XYQA) \quad \dots\dots\dots (ii)$$

Adding (i) and (ii), we get

$$\text{ar}(\triangle BXY) + \text{ar}(\triangle XYAP) = \text{ar}(\triangle CXY) + \text{ar}(\triangle XYQA)$$

$$\Rightarrow \text{ar}(\triangle ABP) = \text{ar}(\triangle ACQ) \quad \text{Hence proved.}$$

2. In the given figure, $ABCDE$ is any pentagon. BP drawn parallel to AC meets DC produced at P and EQ drawn parallel to AD meets CD produced at Q . Prove that $\text{ar}(ABCDE) = \text{ar}(\triangle APQ)$ [NCERT Exemplar]

Sol. Given: $ABCDE$ is any pentagon, $BP \parallel AC$ and $EQ \parallel AD$

To Prove : $\text{ar}(ABCDE) = \text{ar}(\triangle APQ)$

Proof : $\triangle ABC$ and $\triangle APC$ are on the same base AC and between the same parallels BP and AC

$$\therefore \text{ar}(\triangle ABC) = \text{ar}(\triangle APC) \dots\dots\dots(i)$$

Similarly, $\triangle AED$ and $\triangle AQD$ are on the same base AD and between the same parallels AD and EQ

$$\therefore \text{ar}(\triangle AED) = \text{ar}(\triangle AQD) \dots\dots\dots(ii)$$

Adding (i) and (ii), we get

$$\text{ar}(\triangle ABC) + \text{ar}(\triangle AED) = \text{ar}(\triangle APC) + \text{ar}(\triangle AQD) \dots\dots (iii)$$

Adding $\text{ar}(\triangle ACD)$ on both sides of (iii), we get

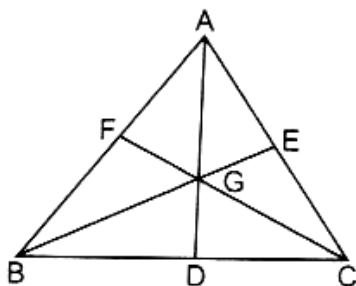

$$\begin{aligned} \text{ar}(\triangle ABC) + \text{ar}(\triangle AED) + \text{ar}(\triangle ACD) \\ = \text{ar}(\triangle APC) + \text{ar}(\triangle AQD) + \text{ar}(\triangle ACD) \end{aligned}$$

$$\Rightarrow \text{ar}(ABCDE) = \text{ar}(\triangle APQ)$$

Hence proved.

3. If the medians of a $\triangle ABC$ intersect at G, show that $\text{ar}(\triangle AGC) = \text{ar}(\triangle AGB) = \text{ar}(\triangle BGC) = \frac{1}{3}(\triangle ABC)$.

Sol. Given : A $\triangle ABC$ in which medians AD, BE and CF intersect each other at G.

To prove: $\text{ar}(\triangle AGC) = \text{ar}(\triangle AGB) = \text{ar}(\triangle BGC)$

$$= \frac{1}{3} \text{ar}(\triangle ABC)$$

Proof : In $\triangle ABC$, AD is the median.

As a median of a triangle divides it into two triangles of equal areas,

$$\therefore \text{ar}(\triangle ABD) = \text{ar}(\triangle ACD) \quad \dots\dots(i)$$

In $\triangle GBC$, GD is the median,

$$\therefore \text{ar}(\triangle GBD) = \text{ar}(\triangle GCD) \quad \dots\dots(ii)$$

Subtracting (ii) from (i), we get

$$\therefore \text{ar}(\triangle ABD) - \text{ar}(\triangle GBD) = \text{ar}(\triangle ACD) - \text{ar}(\triangle GCD) \quad \dots\dots(iii)$$

$$\text{ar}(\triangle AGB) = \text{ar}(\triangle AGC)$$

Similarly,

$$\text{ar}(\triangle AGB) = \text{ar}(\triangle BGC) \quad \dots\dots(iv)$$

From (iii) and (iv), we get

$$\begin{aligned} \text{ar}(\triangle AGB) &= \text{ar}(\triangle BGC) \\ &= \text{ar}(\triangle AGC) \quad \dots\dots(v) \end{aligned}$$

$$\begin{aligned} \text{But } \text{ar}(\triangle AGB) + \text{ar}(\triangle BGC) + \text{ar}(\triangle AGC) \\ &= \text{ar}(\triangle ABC) \quad \dots\dots(vi) \end{aligned}$$

From (v) and (vi), we get

$$3\text{ar}(\triangle AGB) = \text{ar}(\triangle ABC)$$

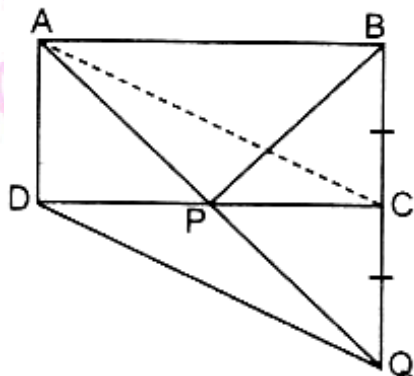

$$\text{ar}(\triangle AGB) = \frac{1}{3} \text{ar}(\triangle ABC)$$

$$\text{Hence, ar}(\triangle AGB) = \text{ar}(\triangle AGC) = \text{ar}(\triangle BGC)$$

$$= \frac{1}{3} \text{ar}(\triangle ABC) \text{ Hence proved.}$$

4. In the given figure, ABCD is a parallelogram. Prove that $\text{ar}(\triangle BCP) = \text{ar}(\triangle DPQ)$,
if $BC = CQ$ [CBSE 2016]

Sol. Given : A parallelogram ABCD in which $BC = CQ$

To prove: $\text{ar}(\triangle BCP) = \text{ar}(\triangle DPQ)$,

Construction : Join AC

Proof : since $\triangle APC$ and $\triangle BPC$ are on the same base PC and between the same parallels PC and AB.

$$\therefore \text{ar}(\triangle APC) = \text{ar}(\triangle BPC) \quad \dots (i)$$

Since ABCD is a parallelogram.

$$AD = BC$$

$$\Rightarrow AD = CQ \quad (\because BC = CQ)$$

Now, $AD \parallel CQ$ and $AD = CQ$

Thus in quadrilateral ADQC, one pair of opposite sides is equal and parallel

\therefore ADCQ is a parallelogram.

$$\Rightarrow AP = PQ \text{ and } CP = DP$$

[Diagonals of a parallelogram bisect each other]

Now, in $\triangle APC$ and $\triangle DPQ$

$$AP = PQ \quad [\text{Proved above}]$$

$$\angle APC = \angle DPQ \text{ [Vertically opposite angles]}$$

$$PC = PD \quad \text{[Proved above]}$$

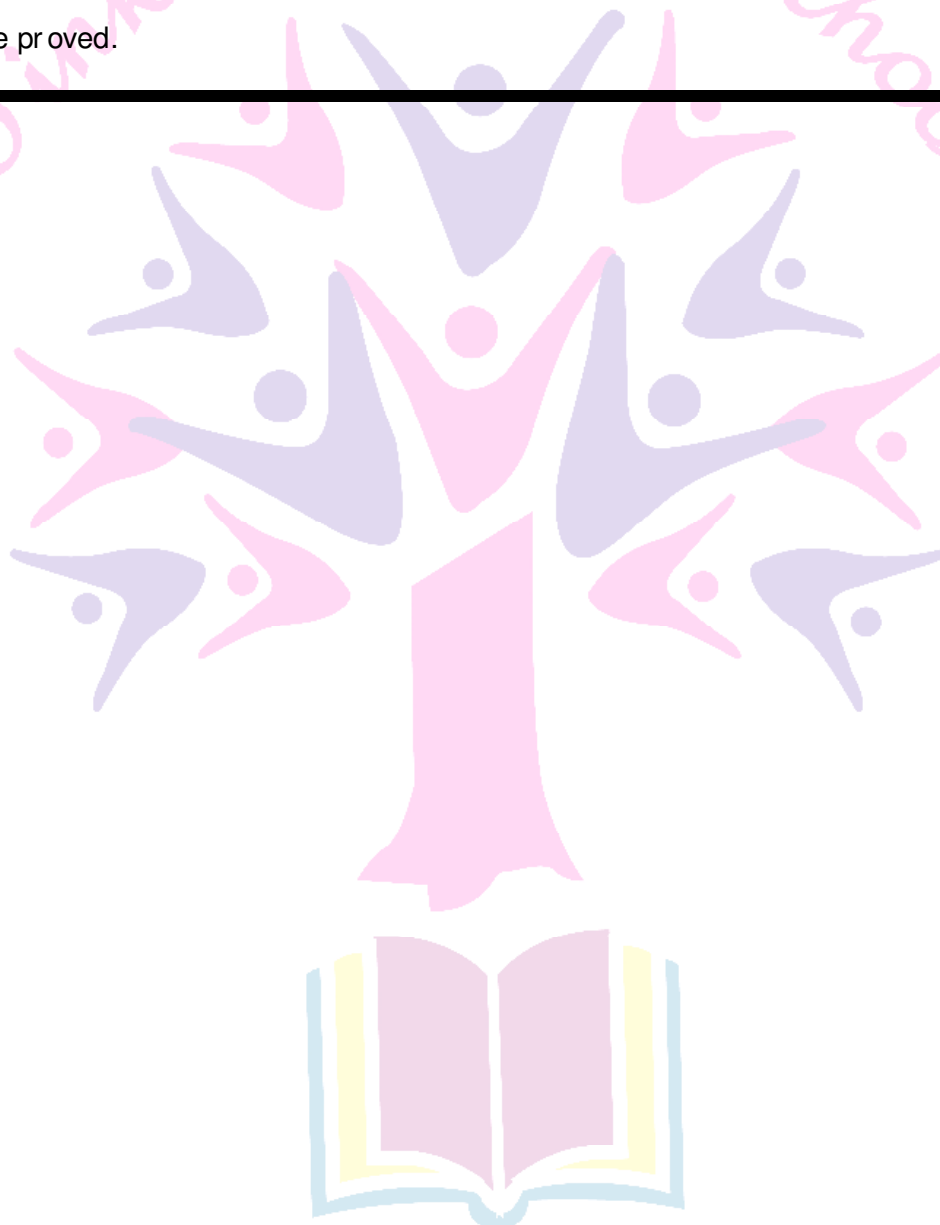

$$\therefore \triangle APC \cong \triangle DPQ \quad \text{[SAS congruence rule]}$$

$$\Rightarrow \ar(\triangle APC) = \ar(\triangle DPQ) \quad \dots\dots\dots(ii)$$

From (i) and (ii), we get

$$\ar(\triangle BCP) = \ar(\triangle DPQ)$$

Hence proved.
